cally acceptable derivatives thereof, that are useful as caspase inhibitors. These  
compounds have the general formula (I): where R<sup>1</sup>, R<sup>2</sup>, and R<sup>3</sup> are as described

lected from nitrogen or carbon, at least on X is Ring A is a nitrogen, Ring A is

urated five to seven membered ring containing zero to three heteroatoms, and

## CASPASE INHIBITORS AND USES THEREOF

### Field of the Invention

This invention is in the field of medicinal chemistry and relates to novel compounds, and pharmaceutical compositions thereof, that inhibit caspases that mediate cell apoptosis and inflammation.

- 5 The invention also relates to methods of using the compounds and pharmaceutical compositions of this invention to treat diseases where caspase activity is implicated.

### Background of the Invention

- 10 Apoptosis, or programmed cell death, is a principal mechanism by which organisms eliminate unwanted cells. The deregulation of apoptosis, either excessive apoptosis or the failure to undergo it, has been implicated in a number of diseases such as cancer, acute  
15 inflammatory and autoimmune disorders, ischemic diseases and certain neurodegenerative disorders (see generally *Science*, 1998, **281**, 1283-1312; Ellis et al., *Ann. Rev. Cell. Biol.*, 1991, **7**, 663).

- Caspases are a family of cysteine protease  
20 enzymes that are key mediators in the signaling pathways for apoptosis and cell disassembly (Thornberry, *Chem. Biol.*, 1998, **5**, R97-R103). These signaling pathways vary depending on cell type and stimulus, but all apoptosis pathways appear to converge at a common effector pathway  
25 leading to proteolysis of key proteins. Caspases are involved in both the effector phase of the signaling

-2-

pathway and further upstream at its initiation. The upstream caspases involved in initiation events become activated and in turn activate other caspases that are involved in the later phases of apoptosis.

5           Caspase-1, the first identified caspase, is also known as interleukin converting enzyme or "ICE." Caspase-1 converts precursor interleukin-1 $\beta$  ("pIL-1 $\beta$ ") to the pro-inflammatory active form by specific cleavage of pIL-1 $\beta$  between Asp-116 and Ala-117. Besides caspase-1  
10 there are also eleven other known human caspases, all of which cleave specifically at aspartyl residues. They are also observed to have stringent requirements for at least four amino acid residues on the N-terminal side of the cleavage site.

15           The caspases have been classified into three groups depending on the amino acid sequence that is preferred or primarily recognized. The group of caspases, which includes caspases 1, 4, 5 and 13, have been shown to prefer hydrophobic aromatic amino acids at position 4  
20 on the N-terminal side of the cleavage site. Another group which includes caspases 2, 3 and 7, recognize aspartyl residues at both positions 1 and 4 on the N-terminal side of the cleavage site, and preferably a sequence of Asp-Glu-X-Asp. A third group, which includes  
25 caspases 6, 8, 9 and 10, tolerate many amino acids in the primary recognition sequence, but seem to prefer residues with branched, aliphatic side chains such as valine and leucine at position 4.

          The caspases have also been grouped according  
30 to their perceived function. The first subfamily consists of caspases-1 (ICE), 4, 5 and 13. These caspases have been shown to be involved in pro-inflammatory cytokine

-3-

processing and therefore play an important role in inflammation. Caspase-1, the most studied enzyme of this class, activates the IL-1 $\beta$  precursor by proteolytic cleavage. This enzyme therefore plays a key role in the inflammatory response. Caspase-1 is also involved in the processing of interferon- $\gamma$  inducing factor (IGIF) which stimulates the production of interferon gamma, a key immunoregulator that modulates antigen presentation, T-cell activation and cell adhesion.

The remaining caspases make up the second and third subfamilies. These enzymes are of central importance in the intracellular signaling pathways leading to apoptosis. One subfamily consists of the enzymes involved in initiating events in the apoptotic pathway, including transduction of signals from the plasma membrane. Members of this subfamily include caspases-2, 8, 9 and 10. The other subfamily, consisting of the effector caspases 3, 6 and 7, are involved in the final downstream cleavage events that result in the systematic breakdown and death of the cell by apoptosis. Caspases involved in the upstream signal transduction activate the downstream caspases, which then disable DNA repair mechanisms, fragment DNA, dismantle the cell cytoskeleton and finally fragment the cell.

Knowledge of the four amino acid sequence primarily recognized by the caspases has been used to design caspase inhibitors. Reversible tetrapeptide inhibitors have been prepared having the structure  $\text{CH}_3\text{CO}-[\text{P}_4]-[\text{P}_3]-[\text{P}_2]-\text{CH}(\text{R})\text{CH}_2\text{CO}_2\text{H}$  where P2 to P4 represent an optimal amino acid recognition sequence and R is an aldehyde, nitrile or ketone capable of binding to the caspase cysteine sulfhydryl. Rano and Thornberry, *Chem.*

-4-

Biol. 4, 149-155 (1997); Mjalli, et al., *Bioorg. Med. Chem. Lett.* 3, 2689-2692 (1993); Nicholson et al., *Nature* 376, 37-43 (1995). Irreversible inhibitors based on the analogous tetrapeptide recognition sequence have been  
5 prepared where R is an acyloxymethylketone  $-\text{COCH}_2\text{OCOR}'$ . R' is exemplified by an optionally substituted phenyl such as 2,6-dichlorobenzoyloxy and where R is  $\text{COCH}_2\text{X}$  where X is a leaving group such as F or Cl. Thornberry et al., *Biochemistry* 33, 3934 (1994); Dolle et al., *J Med. Chem.*  
10 37, 563-564 (1994).

The utility of caspase inhibitors to treat a variety of mammalian disease states associated with an increase in cellular apoptosis has been demonstrated using peptidic caspase inhibitors. For example, in  
15 rodent models caspase inhibitors have been shown to reduce infarct size and inhibit cardiomyocyte apoptosis after myocardial infarction, to reduce lesion volume and neurological deficit resulting from stroke, to reduce post-traumatic apoptosis and neurological deficit in  
20 traumatic brain injury, to be effective in treating fulminant liver destruction, and to improved survival after endotoxic shock. Yaoita et al., *Circulation*, 97, 276 (1998); Endres et al., *J Cerebral Blood Flow and Metabolism*, 18, 238, (1998); Cheng et al., *J. Clin. Invest.*, 101, 1992 (1998); Yakovlev et al., *J Neuroscience*, 17, 7415 (1997); Rodriguez et al., *J. Exp. Med.*, 184, 2067 (1996); Grobmyer et al., *Mol. Med.*, 5, 585 (1999).

In general, the peptidic inhibitors described  
30 above are very potent against some of the caspase enzymes. However, this potency has not always been reflected in cellular models of apoptosis. In addition peptide inhibitors are typically characterized by

-5-

undesirable pharmacological properties such as poor oral absorption, poor stability and rapid metabolism.

Plattner and Norbeck, in *Drug Discovery Technologies*,  
Clark and Moos, Eds. (Ellis Horwood, Chichester, England,  
5 1990).

Recognizing the need to improve the  
pharmacological properties of the peptidic caspase  
inhibitors, peptidomimetic inhibitors have been reported.  
Amongst these, inhibitors where the P3 amino acid has  
10 been replaced by derivatives of 3-aminopyridin-2-ones and  
5-aminopyrimidin-4-ones have received much attention (US  
Patent 5,756,466 (Bemis et al.); Dolle et al. *J. Med.*  
*Chem.* **39**, 2438, (1996); Golec et al. *Bioorg. Med. Chem.*  
*Lett.* **7**, 2181, (1997); Semple et al, *Biorg. Med. Chem.*  
15 *Lett.* **7**, 1337, (1997)) leading to compounds of general  
structure:

where R<sup>1</sup> is hydrogen or various groups, R<sup>2</sup> is hydrogen,  
20 methyl or ethyl, R<sup>3</sup> is alkyl, phenyl or phenalkyl, and R<sup>4</sup>  
is various groups.

Due to the inherent problems of the peptidic  
inhibitors, there continues to be a need for small  
molecule, nonpeptide caspase inhibitors that are potent,  
25 stable, and penetrate membranes to provide effective  
inhibition of apoptosis *in vivo*. Such compounds would be  
extremely useful in treating the aforementioned diseases  
where caspase enzymes play a role.

Isosteres or bioisosteres of carboxylic acids, esters and amides result from the exchange of an atom or group of atoms to create a new compound with similar biological properties to the parent carboxylic acid, ester or amide. The bioisosteric replacement may be physicochemically or topologically based. An example of an isosteric replacement for a carboxylic acid is CONHSO<sub>2</sub>(alkyl) such as CONHSO<sub>2</sub>Me.

Likewise it will be apparent to one skilled in the art that certain compounds of this invention may exist in tautomeric forms or hydrated forms, all such forms of the compounds being within the scope of the invention. Unless otherwise stated, structures depicted herein are also meant to include all stereochemical forms of the structure; i.e., the R and S configurations for each asymmetric center. Therefore, single stereochemical isomers as well as enantiomeric and diastereomeric mixtures of the present compounds are within the scope of the invention. Unless otherwise stated, structures depicted herein are also meant to include compounds which differ only in the presence of one or more isotopically enriched atoms. The compounds of this invention may be prepared in general by methods known to those skilled in the art for analogous compounds, as illustrated by the general Schemes below and by the preparative examples that follow.

Scheme I

15

-20-

Reagents: (a) NaH/THF; (b) NaOH/THF/H<sub>2</sub>O; (c) EDC/DMAP/HOBt; (d) Dess-Martin periodinane; (e) TFA/DCM

In Scheme I above, the following abbreviations are used: EDC is 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide; HOBt is 1-hydroxybenzotriazole; TFA is trifluoroacetic acid; DCM is dichloromethane; and DMAP is 4-dimethylaminopyridine. The starting heterocycle 1, is either commercially available or prepared by methods analogous to those described by Fuss and Koch, *Synthesis* (1990), 681-685, unless stated otherwise. Starting heterocycle 1 is treated first with sodium hydride, then with an ester 2 (LG is a leaving group such as bromine or O-triflate). The resulting ester 3 (e.g., Y = alkyl) is first hydrolyzed using base or, when Y is a t-butyl group, using trifluoroacetic acid. The acid 3 (Y = H) is then coupled with the amino alcohol 4. Depending on the nature of R<sup>1</sup> and R<sup>2</sup> an amino ketone may be used, in place of the amino alcohol, which avoids the subsequent oxidation step. In the case of fluoromethyl ketones where R<sup>1</sup> is CH<sub>2</sub>F, the amino alcohol 4 may be obtained according to the method of Revesz et al., *Tetrahedron Lett.*, 1994, 35, 9693. Finally the hydroxyl in compound 5 is oxidized and the compound treated appropriately according to the nature of R<sup>2</sup>. For example, if the product I requires R<sup>2</sup> to be a carboxylic acid, then R<sup>2</sup> in 4 is preferably an ester and the final step in the scheme is hydrolysis. Accordingly, one aspect of this invention relates to a general method of preparing compounds of formula I comprising the steps of:

- (a) providing an acid or acid derivative of formula II:

-21-

II

- (b) coupling II with an amino alcohol or amino ketone of formula 4 to provide an intermediate of formula III:

- (c) converting intermediate III to compound I, wherein Y is hydrogen or an organic radical; Z is =O or OH; and ring A, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, X<sub>1</sub>, X<sub>2</sub> and X<sub>3</sub> are as described above.

This method is particularly useful for preparing chiral compounds of this invention, where the carbon bearing the R<sup>3</sup> substituent is stereochemically enriched. As exemplified below (see Examples 21-27), intermediate acids or acid derivatives of formula II may be obtained in chiral form. This is illustrated herein for Ring A being a quinazolin-4-one (Examples 21-24, 26), a pyrimidin-4-one (Example 25) and a dihydroquinazoline-3-one (Example 27). The step (b) coupling of II and 4 to provide III may be carried out according to any suitable method. It is understood that when 4 is a ketone (Z = O), it may need to be generated in the presence of II, for example, by *in situ* deprotection of the amino group. In step (c), the conversion of III to provide I will depend on the nature of Z and R<sup>2</sup>. Synthetic manipulation of these groups, if necessary, may be performed as

-22-

described herein or according to other methods familiar to those skilled in the art.

Certain chiral intermediates **II**, useful for making compounds of this invention, are novel. These intermediates are represented by pyrimidinones **IIA** and quinazolinones **IIB**:

(S)-**IIA**(S)-**IIB**

wherein Y is hydrogen or an organic radical, the pyrimidinone and quinazolinone rings are optionally substituted as described above for Ring A, and R<sup>3</sup> is a C<sub>1-6</sub> alkyl group.

**Reagents:** (a) Ethyl formate/diisopropylamine; (b) ArCOCl/THF; (c) PPh<sub>3</sub>/xylene; (d) TFA/DCM; (e) EDC/DMAP/HOBt; (f) Dess-Martin periodinane; (g) TFA/DCM

-23-

In Scheme II above, the starting amino acid ester **6**, which is commercially available or synthesised under standard conditions, is first formylated and then treated with an 2-azido aromatic acid, activated for example as an acid chloride. The resulting amide **7**, is treated with a reducing agent such as triphenyl phosphine and the resulting ester (e.g., Y = alkyl) is hydrolyzed using base or, when Y is a t-butyl group, using trifluoroacetic acid. The synthesis is then completed as outlined in Scheme I.

Reagents: (a) EDC/DMAP/HOBt; (b) HCl/EtOAc; (c)

(EtO)<sub>3</sub>CH/xylene; (d) EDC/DMAP/HOBt; (e) Dess-Martin periodinane; (f) TFA/DCM

In Scheme III above, the starting amino acid ester **6**, which is commercially available or synthesised under known methods, is coupled with an unsaturated amino acid under standard conditions to provide amide **10**. The

-24-

amide **10** is deprotected (e.g., P = Boc) using acid conditions and the resulting amine heated with a formylating agent, eg triethylorthoformate. The intermediate then undergoes a thermal retro-Diels Alder reaction to provide **11**. The synthesis is then completed as outlined in Scheme I.

Scheme IV

Reagents: (a) Et<sub>3</sub>N/EtOH/**18**; (b) RaNi/H<sub>2</sub>/EtOH; (c) CDI/THF; (d) NaH/DMSO/**15**; (e) TFA/DCM; (f) **4**/EDC/DMAP/HOBt; (g) Dess-Martin periodinane; (h) TFA/DCM

-25-

In Scheme IV above, the starting amino acid ester 6 is alkylated with a benzyl group (where LG may be a halogen, tosylate, mesylate, triflate or the like) to provide 13. The nitro group in 13 is reduced (for example with Raney Nickel) and the diamine then cyclized onto a carbonyl source, (e.g. carbonyl diimidazole, "CDI") to provide quinazolone 14. The resulting free NH may be alkylated to provide compound 16. The synthesis is then completed as outlined in Scheme I.

The mixture was allowed to warm to room temperature during 16h then concentrated under

-27-

The residue was purified by flash chromatography (3% methanol in ethyl acetate) to afford the title compound as a white foam (137mg, 92%):  $^1\text{H}$  NMR (400MHz,  $\text{CDCl}_3$ )  $\delta$  1.3-1.5(9H, 2xs), 2.5-2.7(2H, m), 3.4-3.7(1H, m), 3.9-4.6(4H, m), 5.4-5.6(1H, m), 6.2-6.3(1H, m), 6.5-6.6(1H, m), 7.1-7.6(3H, m);  $^{19}\text{F}$  NMR (376MHz,  $\text{CDCl}_3$ )  $\delta$  -230.14, -230.14, -230.17, -230.95, -231.07.

Step D: 5-Fluoro-4-oxo-3-[(S)-2-(2-oxo-2H-pyridin-1-yl)-propionylamino]-pentanoic acid tert-butyl ester

A stirred solution of 5-Fluoro-4-hydroxy-3-[(S)-2-(2-oxo-2H-pyridin-1-yl)-propionylamino]-pentanoic acid tert-butyl ester (135mg, 0.38mmol) in anhydrous DCM (5ml) was treated with 1,1,1-triacetoxy-1,1-dihydro-1,2-benziodoxol-3(1H)-one (193mg, 0.46mmol) at  $0^\circ\text{C}$ . The resulting mixture was kept at  $0^\circ\text{C}$  for 1.5h, diluted with ethyl acetate, then poured into a 1:1 mixture of saturated aqueous sodium hydrogen carbonate and saturated aqueous sodium thiosulphate. The organic layer was removed and the aqueous layer re-extracted with ethyl acetate. The combined organic extracts were dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated. The residue was purified by flash chromatography (1% methanol in ethyl acetate) to afford the title compound as a colorless gum (125mg, 93%):  $^1\text{H}$  NMR (400MHz,  $\text{CDCl}_3$ )  $\delta$  1.2-1.4(9H, 2xs), 2.6-2.9(2H, m), 4.7-4.9(1H, m), 4.9-5.3(2H, m), 5.6-5.7(1H, m), 6.2-6.3(1H, m), 6.5-6.6(1H, m), 7.2-7.4(1H, m), 7.5-7.6(1H, m), 8.0-8.2(1H, m);  $^{13}\text{C}$  NMR (100MHz,  $\text{CDCl}_3$ )  $\delta$  16.57, 16.87, 28.24, 28.29, 36.44, 36.60, 52.50, 52.62, 52.90, 53.09, 82.31, 82.44, 83.51, 83.72, 85.33, 85.55, 107.35, 107.44, 120.45, 120.49, 134.42, 134.67, 140.22, 140.36, 162.85,

5 Step E: 5-Fluoro-4-oxo-3-[(S)-2-(2-oxo-2H-pyridin-1-yl)-propionylamino]-pentanoic acid

The mixture was stirred at 0°C for 0.5h then at room temperature for 0.5h. The mixture was concentrated under reduced pressure and then the residue was redissolved in dry dichloromethane. This process was repeated several times in order to remove excess trifluoroacetic acid. To a suspension of (2S) alanine tert-butyl ester  
5 hydrochloride (3.63g, 20mmol) in a mixture of ethyl  
formate (10 mL) and DCM (5mL) was added  
diisopropylethylamine (3.83mL, 22mmol) and the reaction

the sub-title compound as a colorless oil which  
crystallised upon standing (2.806g, 81%): <sup>1</sup>H NMR (400MHz

20 A stirred solution of (2S)-2-formylamino-propionic acid  
tert-butyl ester (3.524 g, 20.3 mmol) in anhydrous THF  
(50mL) was treated at -78°C with LDA (20.3 mmol) and the  
reaction was stirred for 15min. A solution of 2-

the reaction mixture was stirred at -78°C for 1h before  
being quenched with saturated aq.NH<sub>4</sub>Cl. The reaction was  
allowed to warm to room temperature and the organic layer

Step N: (2S)-2-(4-oxo-4H-quinazolin-3-yl)-propionic acid tert-butyl ester

Triphenylphosphine (3.41 g, 13.0 mmol) was added portionwise to a solution of (2S)-2-(N-(2-azido-benzoyl)-N-formylamino)-propionic acid tert-butyl ester (3.437 g, 10.80 mmol) in xylene (70 mL) at room temperature. The reaction mixture was stirred at room temperature until the evolution of nitrogen ceased (approx. 1h), and then refluxed for 20h. The volatiles were evaporated and the residue was purified by flash chromatography (30% ethyl acetate in hexane) to afford the sub-title compound as a colorless oil (2.221 g, 75%).  $^1\text{H}$  NMR (400MHz  $\text{C}_6\text{D}_6$ )  $\delta$  1.30 (3H, d), 1.34 (9H, s), 4.97 (1H, q), 7.08 (1H, m), 7.31 (1H, m), 7.81 (1H, s), 7.86 (1H, d), 8.55 (1H, m).

Sterile injectable forms of the compositions of this invention may be aqueous or oleaginous suspension. These suspensions may be formulated according to techniques known in the art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or di-glycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such as carboxymethyl cellulose or similar dispersing agents which are commonly used in the formulation of pharmaceutically acceptable dosage forms including emulsions and suspensions. Other commonly used surfactants, such as Tweens, Spans and other emulsifying agents or bioavailability enhancers which are commonly

-61-

used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms may also be used for the purposes of formulation.

The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, aqueous suspensions or solutions. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening, flavoring or coloring agents may also be added.

These can be prepared by mixing the agent with a suitable non-irritating excipient which is solid at room temperature but liquid at rectal temperature and therefore will melt in the rectum to release the drug. Such materials include cocoa butter, beeswax and polyethylene glycols.

The pharmaceutical compositions of this invention may also be administered topically, especially when the target of treatment includes areas or organs readily accessible by topical application, including diseases of the eye, the skin, or the lower intestinal tract. Suitable topical formulations are readily prepared for each of these areas or organs.

-62-

Topical application for the lower intestinal tract can be effected in a rectal suppository formulation (see above) or in a suitable enema formulation. Topically-transdermal patches may also be used.

#### Example 28

#### 25 Enzyme Assays

The assays for caspase inhibition are based on the cleavage of a fluorogenic substrate by recombinant, purified human Caspases -1, -3, -7 or -8. The assays are  
30 run in essentially the same way as those reported by Garcia-Calvo et al. (J. Biol. Chem. 273 (1998), 32608-32613), using a substrate specific for each enzyme. The

-66-

substrate for Caspase-1 is Acetyl-Tyr-Val-Ala-Asp-amino-4-methylcoumarin. The substrate for Caspases -3, -7 and -8 is Acetyl-Asp-Glu-Val-Asp-amino-4-methylcoumarin.

The observed rate of enzyme inactivation at a particular inhibitor concentration,  $k_{obs}$ , is computed by direct fits of the data to the equation derived by Thornberry et al. (Biochemistry 33 (1994), 3943-3939) using a nonlinear least-squares analysis computer program (PRISM 2.0; GraphPad software). To obtain the second order rate constant,  $k_{inact}$ ,  $k_{obs}$  values are plotted against their respective inhibitor concentrations and  $k_{inact}$  values are subsequently calculated by computerized linear regression.

Example 29Inhibition of IL-1 $\beta$  secretion from Mixed Population of  
Peripheral Blood Mononuclear Cells (PBMC)

Processing of pre-IL-1 $\beta$  by caspase-1 can be measured in cell culture using a variety of cell sources.

- 5 Human PBMC obtained from healthy donors provides a mixed population of lymphocyte and mononuclear cells that produce a spectrum of interleukins and cytokines in response to many classes of physiological stimulators.

Experimental procedure

- The test compound is dissolved in dimethyl sulfoxide (DMSO, Sigma #D-2650) to give a 100 mM stock solution. This is diluted in complete medium consisting  
15 of RPMI containing 10% heat inactivated FCS (Gibco BRL #10099-141), 2mM L-Glutamine (Sigma, #G-7513), 100U penicillin and 100  $\mu$ g/ml streptomycin (Sigma #P-7539). The final concentration range of test compound is from 100  $\mu$ M down to 6 nM over eight dilution steps. The  
20 highest concentration of test compound is equivalent to 0.1% DMSO in the assay.

- Human PBMC are isolated from Buffy Coats obtained from the blood bank using centrifugation on Ficoll-Paque leukocyte separation medium (Amersham, #17-  
25 1440-02) and the cellular assay is performed in a sterile 96 well flat-bottomed plate (Nunc). Each well contains 100  $\mu$ l of the cell suspension,  $1 \times 10^5$  cells, 50  $\mu$ l of

-69-

compound dilutions and 50  $\mu$ l of LPS (Sigma #L-3012) at 50 ng/ml final concentration. Controls consist of cells +/- LPS stimulation and a serial dilution of DMSO diluted in the same way as compound. The plates are incubated for  
 5 16-18h at 37 °C in 5%CO<sub>2</sub> & 95% humidity atmosphere.

After 16-18 h the supernatants are harvested after centrifuging the plates at 100 x g at 18 °C for 15 min and assayed for their IL-1 $\beta$  content. Measurement of mature IL-1 $\beta$  in the supernatant is performed using the  
 10 Quantikine kits (R&D Systems) according to manufacturer's instructions. Mature IL-1 $\beta$  levels of about 600-1500 pg/ml are observed for PBMCs in positive control wells.

The inhibitory potency of the compounds can be represented by an IC<sub>50</sub> value, which is the concentration  
 15 of inhibitor at which 50% of the mature IL-1 $\beta$  is detected in the supernatant as compared to the positive controls. Table 11 shows inhibition of IL-1 $\beta$  secretion from peripheral blood mononuclear cells for selected compounds of this invention as determined by the above methods.

Example 30Anti-Fas Induced Apoptosis Assay

Cellular apoptosis may be induced by the binding of Fas ligand (FasL) to its receptor, CD95 (Fas).  
5 CD95 is one of a family of related receptors, known as death receptors, which can trigger apoptosis in cells via activation of the caspase enzyme cascade. The process is initiated by the binding of the adapter molecule FADD/MORT-1 to the cytoplasmic domain of the CD-95  
10 receptor-ligand complex. Caspase-8 then binds FADD and becomes activated, initiating a cascade of events that involve the activation of downstream caspases and subsequent cellular apoptosis. Apoptosis can also be induced in cells expressing CD95 eg the Jurkat E6.1 T  
15 cell lymphoma cell line, using an antibody, rather than FasL, to crosslink the cell surface CD95.  
Anti-Fas-induced apoptosis is also triggered via the activation of caspase-8. This provides the basis of a cell based assay to screen compounds for inhibition of  
20 the caspase-8-mediated apoptotic pathway.

Experimental Procedure

Jurkat E6.1 cells are cultured in complete medium consisting of RPMI-1640 (Sigma No) + 10% foetal  
25 calf serum (Gibco BRL No.10099-141) + 2mM L-glutamine (Sigma No. G-7513). The cells are harvested in log phase of growth. 100ml Cells at  $5-8 \times 10^5$  cells/ml are transferred to sterile 50ml Falcon centrifuge tubes and centrifuged for 5 minutes at 100xg at room temperature.  
30 The supernatant is removed and the combined cell pellets

-71-

resuspended in 25ml of complete medium. The cells are counted and the density adjusted to  $2 \times 10^6$  cells/ml with complete medium.

The test compound is dissolved in dimethyl sulphoxide (DMSO) (Sigma No. D-2650) to give a 100mM stock solution. This is diluted to 400 $\mu$ M in complete medium, then serially diluted in a 96-well plate prior to addition to the cell assay plate.

100 $\mu$ l of the cell suspension ( $2 \times 10^6$  cells) is added to each well of a sterile 96-well round-bottomed cluster plate (Costar No. 3790). 50 $\mu$ l of compound solution at the appropriate dilution and 50 $\mu$ l of anti-Fas antibody, clone CH-11 (Kamiya No. MC-060) at a final concentration of 10ng/ml, are added to the wells.

15 Control wells are set up minus antibody and minus compound but with a serial dilution of DMSO as vehicle control. The plates are incubated for 16-18hrs at 37°C in 5% CO<sub>2</sub> and 95% humidity.

Apoptosis of the cells is measured by the quantitation of DNA fragmentation using a 'Cell Death Detection Assay' from Boehringer-Mannheim, No. 1544 675. After incubation for 16-18hrs the assay plates are centrifuged at 100xg at room temperature for 5 minutes. 150 $\mu$ l of the supernatant are removed and replaced by 150 $\mu$ l of fresh complete medium. The cells are then harvested and 200 $\mu$ l of the lysis buffer supplied in the assay kit are added to each well. The cells are triturated to ensure complete lysis and incubated for 30 minutes at 4°C. The plates are then centrifuged at 1900xg for 10 minutes and the supernatants diluted 1:20 in the incubation buffer provided. 100 $\mu$ l of this solution is then assayed exactly according to the manufacturer's instructions supplied with the kit. OD<sub>405nm</sub>

-72-

is measured 20 minutes after addition of the final substrate in a SPECTRAmax Plus plate reader (Molecular Devices). OD<sub>405nm</sub> is plotted versus compound concentration and the IC<sub>50</sub> values for the compounds are  
5 calculated using the curve fitting program SOFTmax Pro (Molecular Devices) using the four parameter fit option.

Table 12 shows the results of the activity of selected compounds of this invention in the FAS induced apoptosis assay.
